## ABSTRACT

NMIs generally started working on developing climate services by improving access to climate observation and projection data in support of climate risk assessment. Vulnerable actors however are mostly primarily interested in more short term risks of extreme weather events. DRR moves from disaster management to disaster preparedness and prevention – what does this mean for CS by NMIs? What kind of information is needed for which DRR actors and which part of that information can be provided by NMIs and which part requires other data providers?
