

From sectoral to integral approach, part 2: Resilient Cities

Tuesday, 3 November 2015
10:30-12:00, Room II

ABSTRACT

NMIs generally started working on developing climate services by improving access to climate observation and projection data in support of climate risk assessment at international to regional level. Urban managers, planners and designers however are mostly primarily interested in local risks and effects of alternative urban designs for dealing with pluvial flooding and heat risks. What kind of information is needed for whom and which part of that information can be provided by NMIs and which part requires other data providers?
